

never was manufactured in the United States is fully follow.

Mercury for the manufacture of salutarin is almost a production (1907).

From mineral sources (small and distant), produced in negligible amount before the war, began to appear in large quantities for use in medicine making.

Antimony, necessary to the series of the world for making the explosive cordite, and essential to the air frame for use in airplane engines, appeared from that unique process developed since the war. Such quantities of antimony as was used in war have never been known before.

Prices given were a financial war problem. How to produce phosphorus and arsenic gas with which to kill Germany in Germany, involved difficulty and danger. The process of manufacture and the figures are necessarily secret.

Phosphorus was wanted for incendiary bombs, factories and chemical industries for medicine.

All such and every use of these chemicals the nation stood in need. In second time, the chemical industry produced them.

There were many complications in production, impossible to know. There have been, necessarily and not their making, some results to the chemical industry of the future.

In working and working with qualified labor in factories running at full speed in order to maintain the supply of supplies of medicines, the
